

## Frequency count method for complexity

### ① Sum of Array Elements

\* Framework for analysis of Non-recursive functions.

\* Finding complexity of non-recursive algorithm is simpler than that of recursive algorithm.

Step ① Determine size of problem / input

Step ② Find primitive / elementary operations.

Step ③ Find count of primitive operations for best, worst and average case.

Step ④ Simplify the summation by dropping multiplicative and divisive constants of highest degree polynomial term in sum.

### ① Sum of array elements

Say K times

not in times but for sometimes hence say K tiny!

Assume  $P > n$  then execution stops.

The moment comes that  $P = 1+2+\dots+k$

$$P = \frac{K(K+1)}{2}$$

$$\frac{k(k+1)}{2} > n$$

$$\frac{k^2+k}{2} > n$$

$$2^2 * 2 = 2^3$$

$$2^3 * 2 = 2^4$$

Assume  $i >= n$

execution stops.
